marsiglies

ROOFING TILES

antica monferrato

portuguese

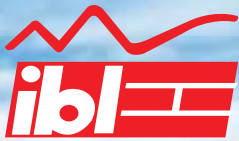

marsiglies

A liquid engobe coating gives a typical aged look: the strong and marked shades of dark tones from terracotta, to bronze, to brown, are perfectly suited to the strong shades that are typical of the northern Italian zones.

ROOFING TILES

antica cassino

portuguese

marsigilies

A liquid engobe coating gives a typical aged look: the variegated shades from white, to terracotta, to bronze, and brown simulate the shaded finish of roofs "marked" by the passing of time.

ROOFING TILES

**dark
brown**

portuguese

marsiglies

The colouring agents applied to the body provide a strong and concrete look: its dark and warm brown shade is perfect for settings requiring dark hues or for contrasting architectural styles

ROOFING TILES

antica sorrento

portuguese

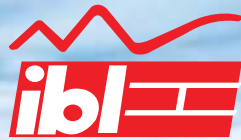

marsiglies

A liquid engobe coating gives a typical aged look: the light and radiant shades from yellow, to amber, to antique rose, suit well to the warm Mediterranean hues of central-southern Italy.

ROOFING TILES

vecchala eturia

portuguese

marsiglies

A dry engobe coating, simulates the encrustations left by time, highlighting the aged look: ideal for all types of restructuring and recovery work or for highlighting the slow passing of time.

ROOFING TILES

**rosso
rubino**

portuguese

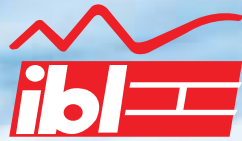

marsiglies

The intense hues provide the roof with a solid and concrete look: the warm and brilliant red shades are perfect for architectural styles in intense colors or strong contrasts.

ROOFING TILES ACCESSORIES

TECHNICAL FEATURES

Fig. : 1
Typical dimensions of the tile support element (timber battens). The batten gauge may vary.

Fig. : 2
The tile supports (battens or mortar fillets) must be laid parallel to the eaves course with gaps of 3-4 cm every 3-4 metres.

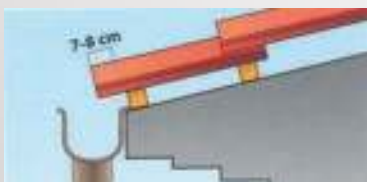

Fig. 3
The first row of tiles must overhang the guttering for about one third of the width of the gutter itself.

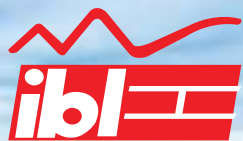

Fig. 4
To maintain the same pitch as the rest of the roof covering, the tiles of the first course should be placed on battens that are two centimetres higher than the others.

LAYING OF THE BATTENS

Timber battens, which are usually in wood and with a section of 4x4 cm (Fig. 1), should be laid parallel to the eaves course ("alia lombarda") (Fig. 2). They should be 3-4 metres long and must be laid at a distance suitable to the tile gauge and separated by a gap of approximately 3-4 cm in order to allow air circulation. Suitably long metal nails will be used to secure the battens to the supporting structure. Otherwise, if this structure cannot be nailed two mortar fillets will be used. The gauge between the first and the second batten, when starting from the eaves course, must be different to the distance between the successive battens because the tiles must overhang slightly from the ridge, for about 1/3 the diameter of the gutter channel (Fig. 3), and, in order to maintain the same pitch as the rest of the roof covering, the first course of battens must be 2 cm higher than the others. (Fig. 4).

CLAY ROOF TILES LAID ON TIMBER BATTENS

Supply and laying of roof coverings using clay roof tile (Portuguese roof tiles, Marsigliese plain roof tiles, Roman roof tiles), in the colour (Natural Red, Rosato, Dark Brown, Antica Cassino, Antica Monferrato, Vecchia Etruria, Antica Sorrento, Rosso Rubino), manufactured by Ceprano Coperture and complete with quality certification, legal and technical suitability guarantee and professionally laid, i.e. perfectly aligned horizontally and vertically on 4x4 cm section timber battens. Each batten will be laid at the right distance in relation to the tile gauge and separated from the contiguous tile by approximately 3-4 cm. Suitably long metal nails will be used to secure the battens to the supporting structure. Otherwise, if this structure cannot be nailed two mortar fillets will be used.
